Software Upgrade Installation Guide

Thank you for purchasing TheGigRig G2 Software Upgrade

Installing your new software is very easy but please make sure you READ THESE INSTRUCTIONS CAREFULLY.

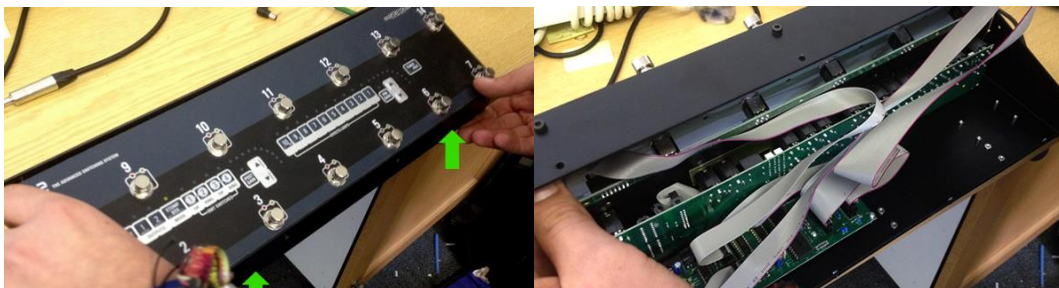

Installing your new G2 software chip:

Step 1 - Undo the screws indicated with the green arrows. **Note** the top row of screws on the front panel **DO NOT** need to be removed.

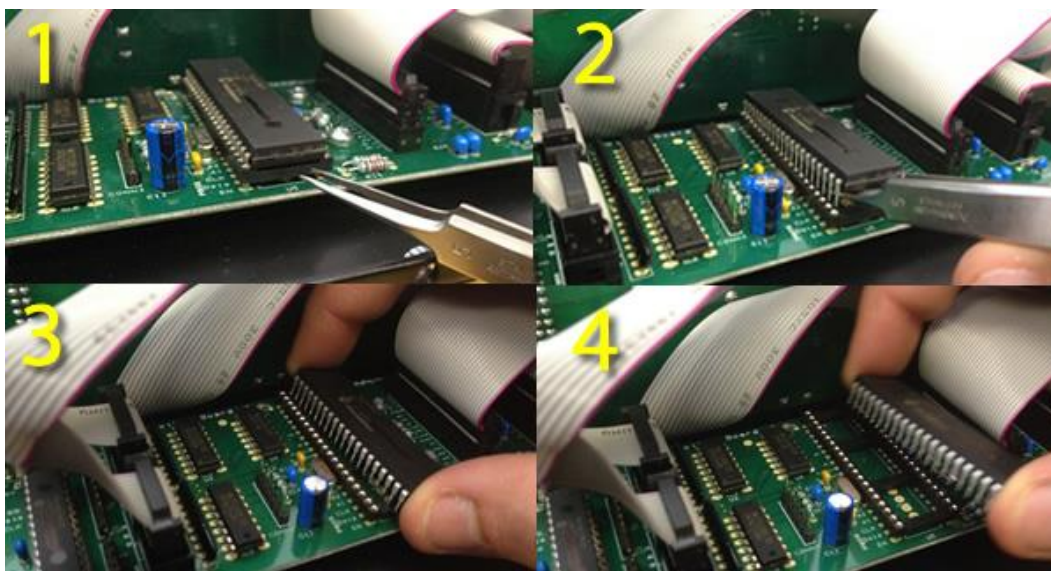

Step 2 - Lift the front and top panel up and place at the rear of the unit.

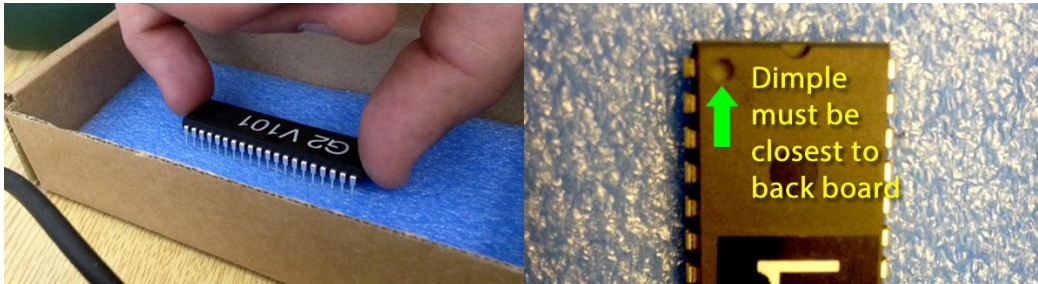

Step 3 - Locate the software chip on the motherboard.

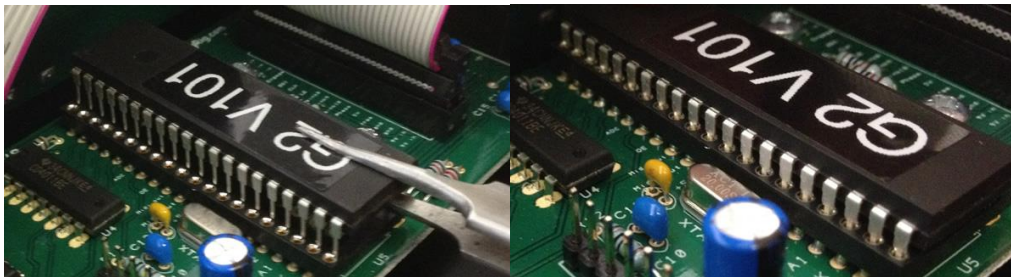

Step 4 - Lever out the chip with a pair of tweezers.

Step 5 - Grab your new software chip. It's important that when you place the chip in the socket the small dimple needs to be closest to the back board.

Step 6 - Using the tweezers insert the software chip. Make sure all the pins are inserted. Apply even pressure and make sure the chip is fully inserted and all pins are socketed.

Step 7 - Replace all screws. Power up holding down footswitch 2. Press and hold footswitch 3 for 2 seconds. Your software upgrade is now complete and your G2 is ready to be programmed.

Enjoy!

Small Print:

The GigRig LTD will not accept liability for damage or injury caused by any use or misuse of this product or from damage or injury caused by any equipment used in conjunction or connected to this G2 Software Chip Upgrade product.
